

Gas Transmission Services

MPW restores peak efficiency within compressor stations by providing turnkey cleaning solutions to meet the demanding needs of the natural gas transmission industry. Aging infrastructure develops leaks and fouling deposits due to years of service without cleaning.

MPW's chemical cleaning services utilize dedicated mobile equipment and technical engineering support to effectively clean glycol cooling loops and jacket water systems. MPW manages all aspects of draining, filtration, flushing and refilling the system. Specialty chemicals used in conjunction with the cleaning process aid in minimizing generated waste, saving off-site disposal fees. Proprietary pumping equipment moves chemicals through the system to remove sludge and scale originating from glycol and additive breakdown, along with removing accumulated iron oxide deposits. MPW's process improves the system's cooling efficiency and extends engine life by improving circulation and heat transfer.

MPW's mobilized high purity deionization (DI) units are used to circulate water through rinse stages until the system proves clean. DI units quickly provide large quantities of water without incurring large overhead costs. High pressure waterblasting and vacuuming remove heavy scale deposits from accessible points of pipe, thus increasing flow capacity. Cutting edge video inspection equipment may be integrated to verify pipeline cleanliness.

From the initial analysis through all phases of cleaning, MPW offers a complete service line that strictly adheres to all safety and environmental rules and regulations during the project.

Contact your local MPW Representative today for more information on MPW's Gas Transmission cleaning capabilities.

MPW's line of dedicated equipment includes high pressure waterblast trucks, industrial vacuum trucks, high volume sewer-jets, proprietary pumping equipment, mobile chemical laboratories, DI water units and Rhino™ tanks.

MPW's Rhino™ tanks are used to contain concentrated and existing system glycol, cleaning chemicals and vacuumed wastewater from process pipe cleaning. MPW provides total management and disposal of wastes.
